

# Life Cycle Assessment (LCA) of PNW alder sawmills: **Product and landscape level comparative assessment**

---

**Indroneil Ganguly**, Associate Professor

Associate Director, Center for International Trade in Forest Products (CINTRAFOR)

SCHOOL OF ENVIRONMENTAL AND FOREST SCIENCES

UNIVERSITY *of* WASHINGTON

College of the Environment

## What we will cover

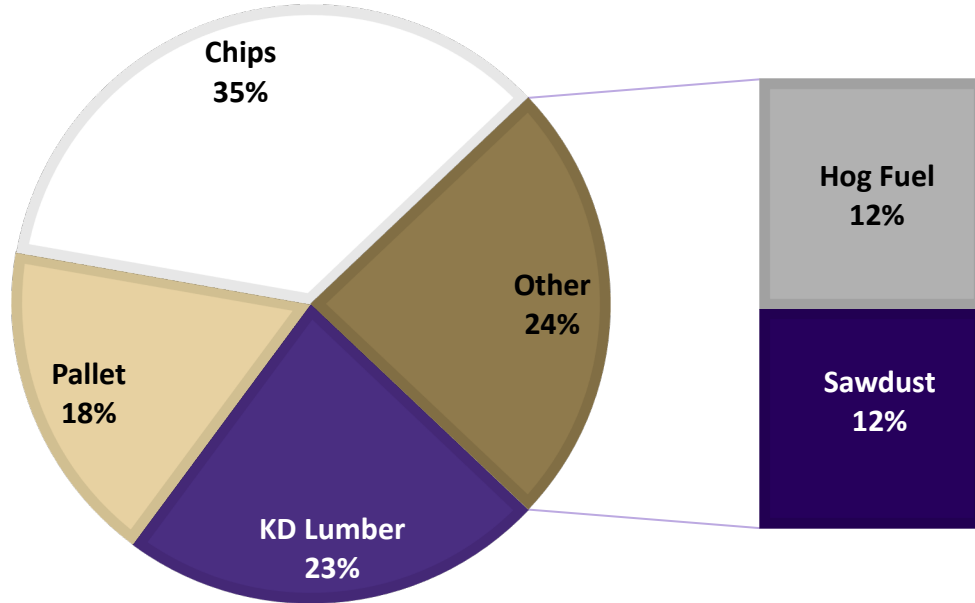

---

- **Results of Life Cycle Assessment of 3 alder sawmills; two in Washington (WA-1 & WA-2) and one in Oregon**
- **Comparative environmental assessment of solid alder cabinet door vs a common alternative**
- **Plot level and landscape level environmental assessment of alder as a natural climate solution in the PNW.**

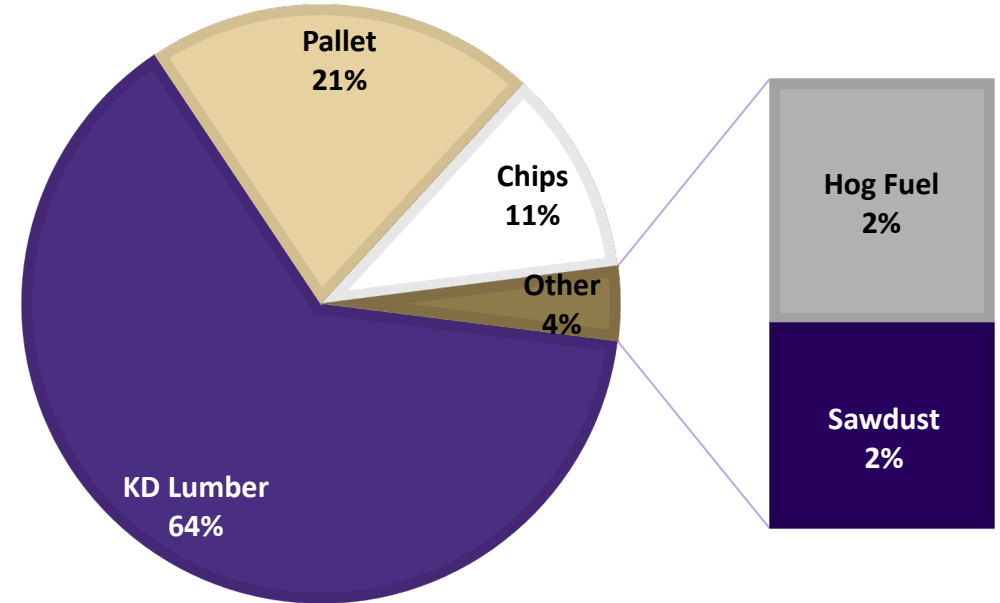

# Alder Product mix relevant to LCA analyses

Mass vs Economic allocation

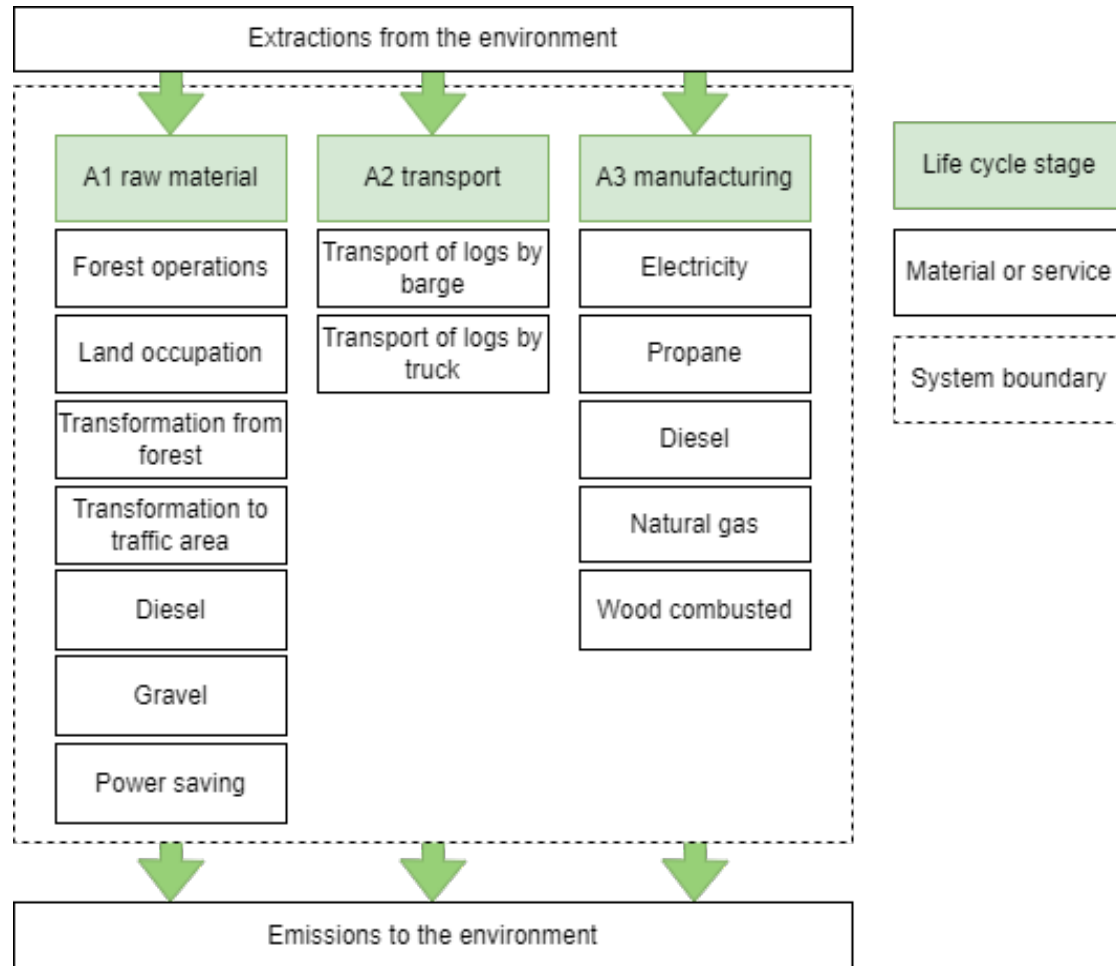

OUTPUT DISTRIBUTION BY BONE DRY WEIGHT

OUTPUT DISTRIBUTION BY REVENUE (\$ VALUE)

# Input and output flows

## Functional unit:

**1 m<sup>3</sup>** (420 kg oven-dry) of kiln-dried, sanded alder lumber

## Locations of the sawmills:

- Mill in Washington 1: WA-1 (data year: 2018)
- Mill in Washington 2: WA-2 (data year: 2018)
- Mill in Oregon: OR-1 (data year: 2020)

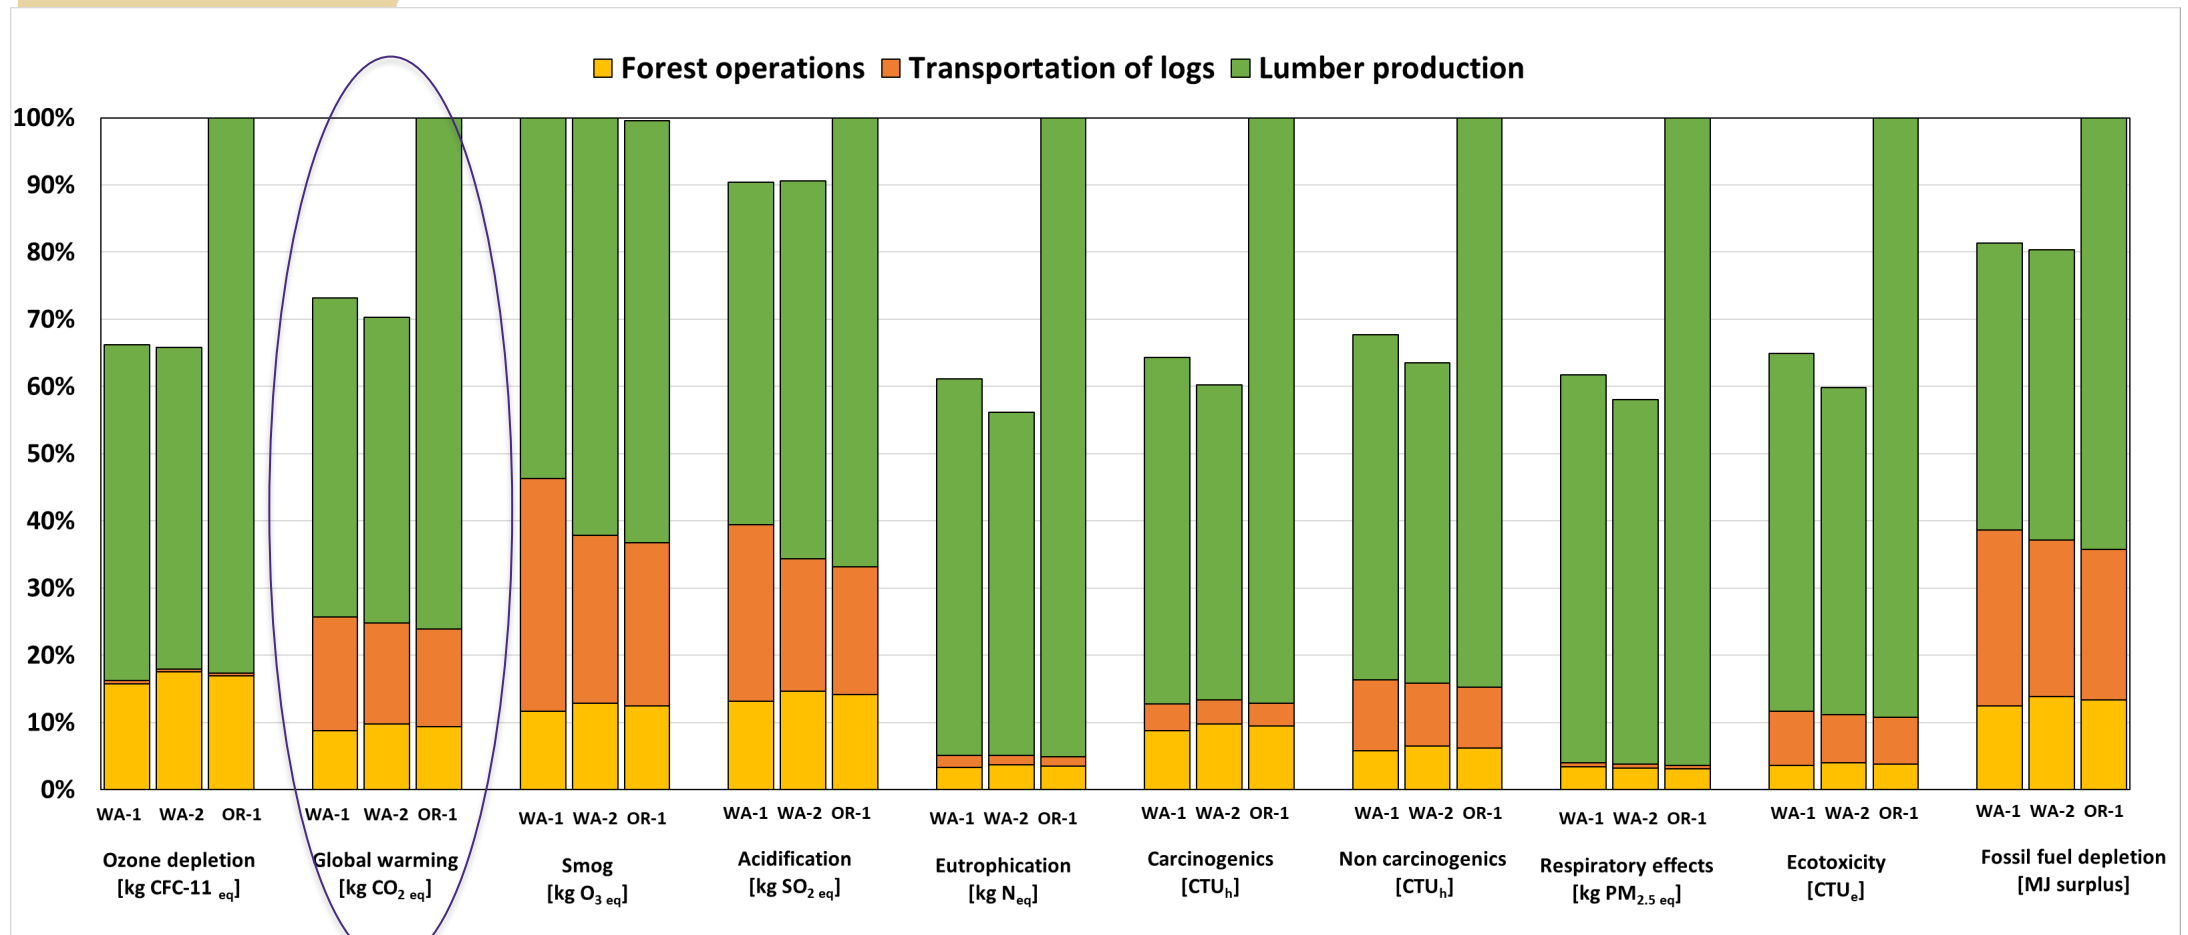

## Transportation distance:

WA-2 and OR-1: red alder is sourced within 80 km from the mill and transported by truck

### WA-1:

- 80% of alder is sourced within 80 km from the mill and transported by truck
- 20% of alder is sourced from British Columbia and transported by water for 402 km. It is then transported from the port to the mill by truck for 40 km.

# Lumber LCA results

# Key findings

---

- **The global warming potential (GWP) (a.k.a, embodied carbon or carbon footprint) is approximately 92 kg CO<sub>2eq</sub> per m<sup>3</sup> of lumber, using an economic allocation.**
  - This number is significantly lower (under 40 kg CO<sub>2eq</sub> per m<sup>3</sup> of lumber), when using a mass allocation
  - Even the economic allocation number is much lower than the national average for hardwood lumber.
- **Generally, environmental footprint of lumber (softwoods and hardwoods) produced in the PNW have lower carbon footprint:**
  - High renewable energy in the electricity mix
  - In western OR and WA, log transportation is much more efficient
- **Use of sawdust for boiler, reduces the use of natural gas and helps reduce the carbon impact**
  - Moreover, high proportion of pallet stock manufacturing reduces the kiln load

# Comparative LCA of a kitchen cabinet door produced with alder board procured from regional sawmills vs. a commonly found kitchen cabinet door

---

# Product information

Natural Alder Finished  
Shaker Panel

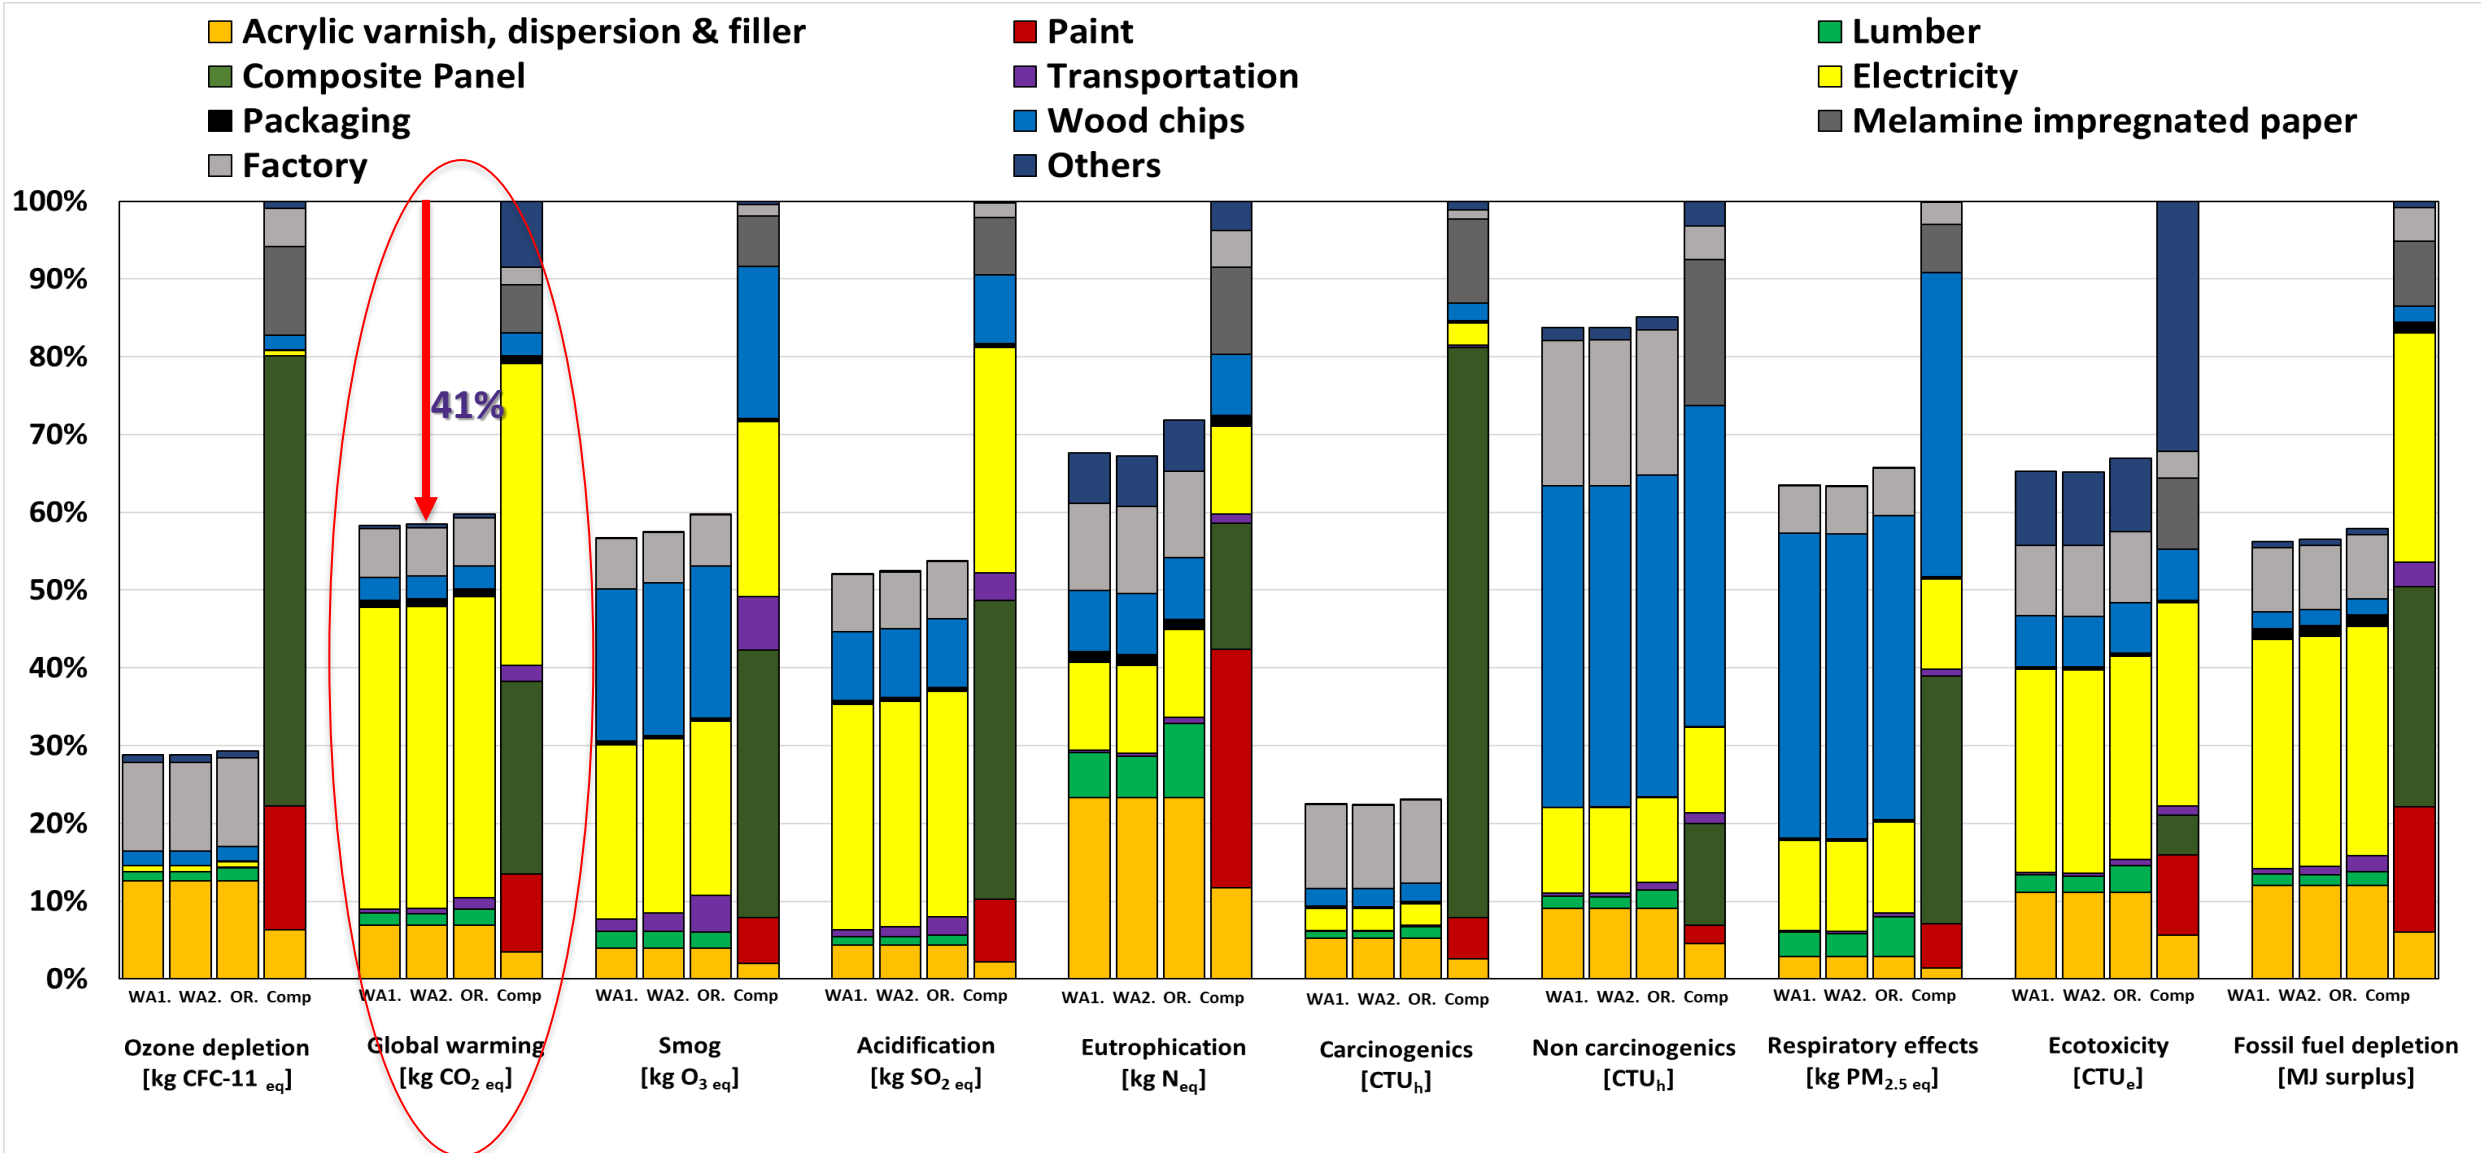

Versus

Regular White Finished  
Shaker Panel

# Comparative analysis results (using mass allocation for alder lumber)

# Comparative analysis results (comparing economic and mass allocation)

## Key findings

---

- **Alder kitchen cabinet doors have a smaller environmental footprint across all the impact categories, as compared to an alternate kitchen cabinet door.**
- **The contribution of alder to the global warming potential of the kitchen cabinet door is only 3% on average.**
  - The contribution of lumber to the environmental impact of the kitchen cabinet door varies from 2.2% to 7.1% on average.
  - So we can state the lower environmental footprint of alder boards primarily contributes to the lower environmental impact of alder cabinets.
- **The electricity consumption is the main contribution to the global warming potential of the kitchen cabinet door.**
  - Hence, the global warming of the kitchen cabinet door can be greatly reduced by increasing the proportion of renewable energy used.

# Plot and landscape level assessment of Alder as a Natural Climate Solution (NCS)

CRF comparison, Red alder vs Douglas-fir

— Red alder (SI:85, HA:30)      — Douglas-fir (SI:145, HA:45)

For this set of forestland in WA State Alder is a better NCS than DF

**Natural Climate Solution?**  
**Yes!**

**Additionally?**  
**Yes!**

**Potential Carbon Credit?**  
**Yes!**

## In Summary

---

- Alder could play an important further improving this NCS role of working forests
- We know that working forests are established to be a natural climate solution in WA state
  - It may be noted that the working forests in WA, dominated by Douglas-Fir and other conifers plantations, play an important GHG mitigating role in the PNW
- With proper planning this NCS role of working forests may be further improved by introduction of more alder plantations in the landscape
  - A carbon-credit case may be made for introduction of red alder in at least 10% (optimistic 30%) of working forest lands in WA

**Thank you for your attention!**
